

C2C Idea Submission

Problem Statement

Modern websites increasingly block AI assistants (ChatGPT, Claude, Perplexity) through cryptographic headers, WAF rules, and bot-detection mechanisms. This creates a paradox: businesses want AI-driven discovery but lack visibility into what's actually blockable, crawlable, or at risk.

Solution

An intelligent, multi-agent framework that simulates advanced AI crawlers, identifies blockages, and generates production-ready code fixes—all explained interactively in a developer-friendly dashboard.

Tech Stack

Frontend: Streamlit(Python)

Simulation core : Playwright Python

Data Extraction and Processing : Crawl4AI or Firewall

AI intelligence and code generation: Groq API or Gemini Flash

Key Outcomes

For Website Risk Assessment

- Automated Vulnerability Discovery: Identifies hidden security blockages, WAF rules, and bot-detection mechanisms without manual pentesting
- Compliance & Resilience Mapping: Documents which cannot crawl your site, with actionable remediation paths
- Security Posture Scoring: Provides a quantified risk score

For AI Assistant Compatibility

- Crawlability Optimization
- In-App Code Fixes
- Incremental Hardening: Enables developers to test fixes in real-time against simulated agent behaviors before pushing to production

For Developers & Security Teams

- Multi-Persona Agent Simulation
- Intelligent Recommendations
- Dashboard Integration

Use Cases

- E-commerce & SaaS Platforms
- News & Publishing
- Enterprise Security
- API & SDK Providers: Test whether documentation and examples can be effectively crawled by AI assistants building on your platform

Impact

This tool redefines the intersection of AI accessibility and web security, moving from binary blocking/allowing strategies to intelligent, adaptive frameworks. Organizations can now confidently expose content to AI agents while maintaining security posture—unlocking new discovery channels and AI-native user experiences.

Expected Outcomes

- Automated vulnerability discovery for AI crawler access
- Production-ready code fixes generated on-demand
- Compliance scoring and risk prioritization
- Real-time testing of fixes against multi-persona crawlers
